

What is claimed is:

1. A portable wireless terminal comprising a first case having a front surface and a rear surface, a second case having a front surface and a rear surface and provided with a display, and an interconnecting mechanism for interconnecting the two cases, the second case connecting to the first case by the interconnecting mechanism so that the second case is closable to a first posture wherein at least a part area of front surface of the first case is covered and is openable to a second posture wherein the part area is exposed, the display being arranged at a position such that the display is exposed regardless of whether the second case is set to the first posture or to the second posture, the part area having a pointing device projecting therefrom in a direction apart from the front surface of the first case and for an input manipulation on a screen presented on the display, the second case having an opening extending through the case from the front surface thereof to the rear surface thereof at the position opposed to the pointing device when in the first posture.

2. A portable wireless terminal according to claim 1 wherein the pointing device is in the form of a bar, and is movable so as to tilt upwardly, downwardly, rightwardly or leftwardly with its base end serving as a fulcrum.

3. A portable wireless terminal according to claim 1 wherein the interconnecting mechanism comprises a hinge mechanism for openably interconnecting the first case and the second case, the front surface of the second case is opposed  
5 to the front surface of the first case in the first posture; in the meantime, the front surface of the second case is apart from the front surface of the first case in the second posture, the display is disposed on the rear surface of the second case serving as a sub-display; in the meantime, a main display is  
10 disposed on the front surface of the second case, the opening provides a through bore having an inner peripheral wall to surround the pointing device, the pointing device functions for a screen presented on the sub-display in the first posture; in the meantime, the pointing device functions for a  
15 screen presented on the main display in the second posture.

4. A portable wireless terminal according to claim 3 wherein the hinge mechanism comprises a first barrel portion which is provided on an upper end of the first case and a second barrel portion which is provided on a lower end of the  
20 second case, and the first and second barrel portions are interconnected coaxially to move rotatably relative to one another, the pointing device is provided on the first barrel portion.

5. A portable wireless terminal according to claim 1

wherein the interconnecting mechanism comprises a sliding mechanism for slidably interconnecting the first case and the second case one another, the two cases are slidably lapped over one another with the front surface of the first case  
5 opposed to the rear surface of the second case, the two cases are lapped over in the greatest area in the first posture; in the meantime, the two cases are lapped over in the smallest area in the second posture, the display is disposed on the front surface of the second case, and the opening is formed by  
10 a notch having a U-shaped opening opposed to the pointing device.
